FIGURE 23.34. (A) Self-fertilization has evolved several times within the genus *Amsinckia*. However, selfing species are confined to the tips of the phylogeny, indicating recent origin. (B) Selfing species retain flowers, but these tend to be smaller. (Left) *Amsinckia furcata*, an outcrosser; (right) its sister taxon *Amsinckia vernicosa*, which is predominantly self-fertilizing.
